5. FOUNDATION WALLS: HOLLOW BLOCK MASONRY FOUNDATION WALLS SHALL BE CONSTRUCTED WITH EITHER A CONTINUOUS COURSE OF SOLID MASONRY, ONE COURSE OF MASONRY GROUTED SOLID, or A SOLID CONCRETE BEAM AT OR ABOVE FINISHED GROUND SURFACE TO PREVENT THE PASSAGE OF AIR FROM THE INTERIOR OF THE WALL INTO THE LIVING SPACE. WHERE A BRICK VENEER OR OTHER MASONRY LEDGE IS PRESENT, THE COURSE IMMEDIATELY BELOW THE LEDGE SHALL BE SOLID. JOINTS, CRACKS OR OTHER OPENINGS AROUND ALL PENETRATIONS OF BOTH EXTERIOR AND INTERIOR SURFACES OF MASONRY BLOCK OR POURED FOUNDATION WALLS SHALL BE FILLED WITH A POLYURETHANE CAULK OR EQUIVALENT SEALANT. PENETRATIONS OF CONCRETE WALLS SHALL BE FILLED.
6. DAMPPROOFING: THE EXTERIOR SURFACE OF CONCRETE AND MASONRY BLOCK WALLS BELOW THE GROUND SURFACE SHALL BE DAMPPROOFED IN ACCORDANCE WITH SECTION R406.
7. AIR-HANDLING UNITS: AIR-HANDLING UNITS IN DWELLING UNITS SHALL BE SEALED TO PREVENT AIR FROM BEING DRAWN INTO THE UNIT.
   EXCEPTION: UNITS WITH GASKETED SEAMS OR UNITS THAT ARE OTHERWISE SEALED BY THE MANUFACTURER TO PREVENT LEAKAGE.
8. DUCTS: DUCTWORK PASSING THROUGH OR BENEATH A SLAB SHALL BE OF SEAMLESS MATERIAL UNLESS THE AIR-HANDLING SYSTEM IS DESIGNED TO MAINTAIN CONTINUOUS POSITIVE PRESSURE WITHIN SUCH DUCTING. JOINTS IN SUCH DUCTWORK SHALL BE SEALED TO PREVENT AIR LEAKAGE.
   DUCTWORK LOCATED IN CRAWL SPACES SHALL HAVE SEAMS AND JOINTS SEALED BY CLOSURE SYSTEMS IN ACCORDANCE WITH SECTION M1601.4.1.
9. CRAWL SPACE FLOORS: OPENINGS AROUND ALL PENETRATIONS THROUGH FLOORS ABOVE CRAWL SPACES SHALL BE CAULKED OR OTHERWISE FILLED TO PREVENT AIR LEAKAGE.
10. CRAWL SPACE ACCESS: ACCESS DOORS AND OTHER OPENINGS OR PENETRATIONS BETWEEN BASEMENTS AND ADJOINING CRAWL SPACES SHALL BE CLOSED, GASKETED OR OTHERWISE FILLED TO PREVENT AIR LEAKAGE.

PASSIVE SUBMEMBRANE DEPRESSURIZATION SYSTEM: IN BUILDINGS WITH CRAWL SPACE FOUNDATIONS, THE FOLLOWING COMPONENTS OF A PASSIVE SUBSLAB DEPRESSURIZATION SYSTEM SHALL BE INSTALLED DURING CONSTRUCTION: (CRC AF103.5) (CRC AF103.5(EXCEPTION))

VENTILATION: CRAWL SPACES SHALL BE PROVIDED WITH VENTS TO THE EXTERIOR OF THE BUILDING. THE MINIMUM NET AREA OF VENTILATION OPENINGS SHALL COMPLY WITH SECTION R408.1. (CRC AF103.5.1)

SOIL-GAS-RETARDER: THE SOIL IN CRAWL SPACES SHALL BE COVERED WITH A CONTINUOUS LAYER OF MINIMUM 6-MIL (0.15 MM) POLYETHYLENE SOIL-GAS-RETARDER, THE GROUND COVER SHALL BE LAPPED NOT LESS THAN 12 INCHES (305 MM) AT JOINTS AND SHALL EXTEND TO ALL FOUNDATION WALLS ENCLOSING THE CRAWL SPACE. (CRC AF103.5.2)

VENT PIPE: A PLUMBING TEE OR OTHER APPROVED CONNECTION SHALL BE INSERTED HORIZONTALLY BENEATH THE SHEETING AND CONNECTED TO A 3- OR 4-INCH-DIAMETER (76 OR 102 MM) PIPING WITH A VERTICAL VENT PIPE INSTALLED THROUGH THE SHEETING. THE VENT PIPE SHALL BE EXTENDED UP THROUGH THE BUILDING FLOORS, AND TERMINATE NOT LESS THAN 12 INCHES (305 MM) ABOVE THE ROOF IN A LOCATION NOT LESS THAN 10 FEET (3048 MM) FROM ANY OPENING IN ADJACENT BUILDINGS. (CRC AF103.5.3)

PASSIVE SUBSLAB DEPRESSURIZATION SYSTEM: IN BASEMENT OR SLAB-ON-GRADE BUILDINGS, THE FOLLOWING COMPONENTS OF A PASSIVE SUBSLAB DEPRESSURIZATION SYSTEM SHALL BE INSTALLED DURING CONSTRUCTION: (CRC AF103.6)

VENT PIPE: A MINIMUM 3-INCH-DIAMETER (76 MM) PIPE SHALL BE INSERTED DIRECTLY INTO AN INTERIOR FORMETER DRAIN TILE LOOP OR THROUGH A SLAB ACCEPTABLE OR OTHER PERMEABLE MATERIAL BEFORE THE SLAB IS CAST. A "T" FITTING OR EQUIVALENT METHOD SHALL BE USED TO ENSURE THAT THE PIPE OPENING REMAINS WITHIN THE SUBSLAB PERMEABLE MATERIAL. EXCAVATE THE SOIL BENEATH PIPE SHALL BE INSERTED DIRECTLY INTO AN INTERIOR FORMETER DRAIN TILE LOOP OR THROUGH A SLAB SUMP COVER WHERE THE SUMP IS EXPOSED TO THE SUBSLAB AGGREGATE OR CONNECTED TO IT THROUGH A DRAINAGE SYSTEM.

Other Geologic Hazards

Other geologic hazards such as landsliding, or highly expansive soils, do not appear to be evident at the subject site. There is not sufficient topography for landsliding. The subject lot is outside the seismic hazards mapped boundaries (see Figure 4, Seismic Hazards).

FINDINGS

Subsurface Soils

As encountered in our test borings, the site is underlain by, fill and native materials as follows:

Fill (Af)

Fill soils were encountered in each of the borings to a depth of approximately 2 to 2½ feet b.g. The fill soils consist generally yellowish brown, moists, fine- to medium-grained, silty sand with gravel.

Based on the laboratory results, the project on-site soil maximum density shall be 121.0 pcf with an optimum moisture content of 10.0%.

Native (Terrace Deposits)

Underlying the fill materials are older Quaternary-age terrace/paralic deposits as encountered in each of the test borings (B-1 through B-3) to the maximum depths explored (15 ft b.g.). The native soils consist generally of light to medium brown, damp to moist, medium dense to dense, fine- to medium-grained sand and silty sand. The native materials become more dense and less weathered with depth.

EXPANSIVE SOILS

Based on the laboratory results and the findings of our geotechnical investigation, the on site soils consist of non-expansive silty sand and sand. No additional measures for mitigation of highly expansive or highly plastic soils are warranted.

CONCLUSIONS

Based on our geotechnical study of the site, our review of available reports and literature and our experience, it is our opinion that the proposed improvements at the site are feasible from a geotechnical standpoint. There appear to be no significant geotechnical constraints on-site that cannot be mitigated by proper planning, design, and utilization of sound construction practices. The engineering properties of the soil and native materials, and the surface drainage offer favorable conditions for site re-

development.

RECOMMENDATIONS

The following sections discuss the principle geotechnical concerns which should be considered for proper site re-development (includes ground level and basement level slabs). The precise limits (elevations) of the basement were not available at this date.

Earthwork - Upper Pad

Grading and earthwork should be performed in accordance with the following recommendations and the General Earthwork and Grading Guidelines included in Appendix C. It is our understanding that the majority of grading will be limited to the re-grading of the building pad for the proposed new construction. In general, it is anticipated that the removal and re-compaction of the upper 3 feet within the upper building footprint (slab-on-grade portion) will be required.

Where feasible, we recommend a 5 feet wide envelope be excavated beyond the building limits. The removals should ensure that all old fill and backfill created as part of the previous site use and demolition operations are removed.

Care should be taken to protect the adjacent property improvements. A minimum one foot thick fill blanket should be placed throughout the exterior improvements (approaches, parking and planter areas). The fill blanket will be achieved by re-working (scarifying) the upper 12 inches of the existing grade.

Site Preparation

Prior to earthwork or construction operations, the site should be cleared of surface structures and buried obstructions and stripped of any vegetation, trees, and roots in the areas proposed for development. Removed vegetation and debris should then be disposed of off-site. A minimum of 3 feet of the soils below the existing street grade (upper pad) will require removal and recompaction in the areas to receive building pad fill.

Following removals, each excavated area should be inspected by the soils engineer or his designated representative prior to the placement of any fill. Holes or pockets of undocumented fill resulting from removal of buried obstructions discovered during this inspection should be filled with suitable compacted fill.

Earthwork - Lower Basement Pad

For the basement subgrade, a minimum one foot of compacted fil should be placed. The fill blanket will be achieved by re-working (scarifying) the upper 12 inches of the basement grade. For a more detailed description of the basement

slab section, see "Basement Underslab" section below.

Fills

The on-site soils are suitable for reuse as compacted fill, provided the soil is free of organic materials, debris, and rock materials larger than four (4) inches in diameter. After removal of any loose, compressible soils, all areas to receive fill and/or other surface improvements should be scarified to a minimum depth of 12 inches, brought to at least 2 percent over optimum moisture conditions and compacted to at least 90 percent relative compaction (based on ASTM: D 1557). If necessary, import soils for near-surface fills should be predominately granular, possess a very low expansion potential, and be approved by the geotechnical engineer.

Lift thicknesses will be dependent on the size and type of equipment used. In general, fill should be placed in uniform lifts **not exceeding 8 inches**. Placement and compaction of fill should be in accordance with local grading ordinances under the observation and testing of the geotechnical consultant. We recommend that fill soils be placed at moisture contents at least 2 percent over optimum (based on ASTM: D 1557).

Backfill Suitability

The on-site soils may be used as trench backfill provided they are screened of rock sizes over 4 inches in mean diameter and any and organic matter. Trench backfill should be compacted in uniform lifts (not exceeding 8 inches in compacted thickness) by mechanical means to at least 90 percent relative compaction (ASTM: D1557).

Geotechnical Design Parameters

The following geotechnical recommendations may used in the design of the proposed structures:

Conventional Foundation Design

Structures on properly compacted fill may be supported by conventional, continuous or isolated pad footings. Footings should be a minimum of 24 inches deep by 15 inches wide. At this depth footings founded in fill materials may be designed for an allowable bearing value of 1,750 psf and 2,250 psf (for dead-plus-live load) for continuous wall and isolated pad footings, respectively. These values may be increased by one-third for loads of short duration, including wind or seismic forces.

Continuous perimeter and interior footings should have a minimum width of 15 inches and be reinforced with No. 5 rebar (two at the top and two at the bottom).

Reinforcement requirements may be increased if recommended by the project structural engineer. In no case should they be decreased from the previous recommendations.

Lateral Load Resistance - New Building

Footings founded in fill materials may be designed for a passive lateral bearing pressure of 250 pounds per square foot per foot of depth. A coefficient of friction against sliding between concrete and soil of 0.30 may be assumed.

Soil Unit Weight

For the upper 12 feet, we recommend a soil unit weight of 120 pcf. The unit weight may be reduced to 110 pcf for the native soils.

Slabs-on-grade - Conventional Option

Concrete slabs cast against properly compacted fill materials, or approved native material, shall be a minimum of 5 inches thick (actual) and reinforced with No. 4 rebar at 18 inches on center in both directions. The slabs shall be doweled into the footings using No. 4 bars at 24 inches on center. The reinforcement shall be supported on chairs to insure positioning of the reinforcement at mid-center in the slab.

All living area floor mat slabs shall comply with the "Capillary Break" section below, herein (does not apply to basement slab where certified waterproofing upgrade is imperative).

Some slab cracking due to shrinkage should be anticipated. The potential for the slab cracking may be reduced by careful control of water/cement ratios. The contractor should take appropriate curing precautions during the pouring of concrete in hot weather to minimize cracking of slabs. We recommend that a slipsheet (or equivalent) be utilized if crack-sensitive flooring is planned directly on concrete slabs. All slabs should be designed in accordance with structural considerations.

Capillary Break - for Conventional Floor Slab Design

In accordance with the 2022 California Green Building Standards Code Section 4.505.2.1, we provide the following building specification for the subject site (new living area slabs):

> New concrete building slabs shall be underlain by 2 inches of clean sand, underlain by a minimum 15 mil-thick moisture barrier (e.g. "Stego Wrap"), with all laps sealed, underlain by 4 inches of ½-inch or larger clean gravel.

We do not advise placing sand directly on the gravel layer as this would reverse the effects of vapor capture and increase soil settlement (due to siltation of fines).

The above specification meets or exceeds the Section 4.505.2.1 requirement.

Mat Foundation Design

A mat slab foundation system is recommended for the basement. Mat slabs founded in compacted fill or competent native materials may be designed for an allowable bearing value of 1,500 psf (for dead-plus-live load). These values may be increased by one-third for loads of short duration, including wind or seismic forces. The actual design of the mat slab should be designed by the structural engineer.

MIN. DESIGN ITEM	RECOMMENDATIONS
Mat Foundations:	
allowable bearing pressure:	1,500 psf
passive lateral resistence:	250 psf per foot
mat slab thickness:	min. 12 inches with thickened edges (+ 6 inches)
steel reinforcement:	no. 5 bars @ 12" o.c. each way, top and bottom
coefficient of friction:	0.30
Modulus of Subgrade Reaction:	k_s = 90lbs/in^3

Joints in walls and floors, and between the wall and floor, and penetrations of the wall and floor shall be made watertight using suitable methods and materials (e.g. bentonite "water stops").

Basement Underslab

We recommend the bottom of the basement excavation be scarified to 12 inches and re-compacted to a minimum 90% relative compaction. The basement pad (12 inches below the bottom of the basement slab) should be overlain by 4 inches of ½-inch gravel covered by filter fabric. To counter against the effects of migrating nuisance/perched water we recommend a minimum 4-inch thick weighted slab (a.k.a. "rat" slab) be poured above the gravel and fabric layer. The waste slab shall be overlain by waterproofing (e.g. "Carlisle Waterproofing Products") which extends up the wall faces, and then overlain by a minimum 4-inch "protection slab" and then overlain by a minimum 12-inch structural mat slab.

We recommend the waterproofing be inspected and certified by a trained expert. The protection slab is crucial in preserving the underlying waterproofing from puncture or damage during construction. Steel reinforcement is not required for the protection slab or the waste slab.

We recommend a minimum 4,000 psi concrete pour for the mat slab, to be designed by the project structural engineer.

Waterproofing

Basement wall and slabs shall be waterproofed in accordance with section 1805 of the 2022 CBC. Permanent waterproofing of the basement slab and basement walls is required. Waterproofing shall consist of rubberized asphalt, polymer-modified asphalt, butyl rubber, or other approved materials capable of bridging non-structural cracks (e.g. "Carlisle Waterproofing Products"). Joint in the membrane shall be lapped and sealed in an approved manner. Protection board shall be used to protect the membrane at the face of basement walls, during and after backfilling. Joints and protrusions in walls and floors, and between the wall and floor, and penetrations of the wall and floor shall be made watertight using suitable methods and materials (e.g. bentonite "Water Stops").

The contractors shall strictly follow the manufacturer's recommendations for the for surface preparation and use of water-proofing products. A third-party waterproofing expert shall be retained to inspect and verify the waterproofing installation.

Cement Type for Concrete in Contact with On-Site Earth Materials

Concrete mix design should be based on sulfate testing with Section 1904.2 of the 2022 CBC. Preliminary laboratory testing indicates the site soils possess negligible sulfate exposure (13 ppm by volume). Test Results are presented in Appendix B.

ACI 318-14 BUILDING CODE (Table 19.3.1.1)
REQUIREMENTS FOR CONCRETE EXPOSED TO SULFATE-CONTAINING SOLUTIONS

Sulfate Exposure	Water soluble sulfate (SO_4) in soil percent by weight	Sulfate (SO_4) in water, ppm	Cement Type	Maximum water-cementitious material ratio, by weight, normal weight concrete	Minimum f'c, normal-weight and light weight concrete, psi
Negligible [S0]	$0.00 \le SO_4 < 0.10$	$0 \le SO_4 < 150$	-----	-----	-----
Moderate [S1]	$0.10 < SO_4 < 0.20$	$150 < SO_4 < 1500$	II,IP(MS), IS(MS),P(MS) I(PM)(MS), I(SM)(MS)	0.50	4000
Severe [S2]	$0.20 \le SO_4 < 2.00$	$1500 < SO_4 < 10,000$	V	0.45	4500
Very Severe [S3]	$SO_4 > 2.00$	$SO_4 > 10,000$	V plus pozzalan	0.45	4500

As a conservative approach, cement with a maximum water/cement ratio of 0.50 and a concrete strength f'c of 3,000 psi should be used for concrete in contact with on-site earth materials (min. 4,000 psi applies to the basement slab).

Retaining/Basement Wall Design

To date, the precise limits and heights of the proposed basement and exterior retaining walls are not known. However, based on conceptual plans, we assume shoring will be required along the north, east, and west side yards.

All retaining/basement and landscape wall footings will be embedded into fill compacted to a minimum 90% relative compaction or competent native materials. The following equivalent fluid pressures may be used in the design of the site retaining walls assuming free draining conditions (clean sand or gravel backfill):

	Equivalent Fluid Pressure (EFP)	
Condition	Level	2 :1 Slope
Active Pressures	45 pcf	85 pcf
At-Rest Pressures	65 pcf	120 pcf
Coefficient of Friction	0.30	
Passive Pressures	250 psf per foot	
Seismic Pressures	19 pcf	

The above passive pressure values do not contain an appreciable factor of safety. Therefore, the structural engineer should apply the applicable factors of safety and/or load factors during design.

This office shall be contacted to provide additional recommendations if actual conditions are different than those assumed above.

Lateral Pressure - New Retaining Walls

A passive earth pressure of 300 pounds per square foot per foot of depth, to a maximum value of 3,500 pounds per square foot, may be used to determine lateral bearing resistance for footings. An increase of one-third of the above values may also be used when designing for short duration wind and seismic forces.

The above lateral resistance values are based on footing placed directly against competent native soils or compacted fill. In cases where footing sides are formed, all backfill placed against the footings should be compacted to at least 90 percent of the applicable maximum dry density value.

Seismic Loads

In accordance with Section 1803.5.12 of the 2022 CBC, for design purposes, a seismic earth pressure of 19 pcf (additional equivalent fluid pressure) may be used for the shoring and the basement wall design. For this, the allowable soil pressure may be increased by one-third.

Settlement

Utilizing the design recommendations presented herein, we anticipate that the majority of any post-grading settlement will occur during construction activities.

Based on our subsurface investigation (including the consolidation test results), we estimate that the total settlement for the proposed structure will be on the order of ¾ -inch. Differential settlement is expected to be less than 0.36 inch over 30 feet. These settlement values are expected to be within tolerable limits for properly designed and constructed foundations.

Retaining Wall Backfill Material

It is recommended that a minimum 2-foot thick layer of free-draining granular material (less than 5 % passing the No. 200 sieve) be placed against the back face of the retaining walls. This material should be approved by the geotechnical engineer. This layer of granular material should be separated from the adjacent soils using a suitable geotextile fabric. If the layer of free-draining material is not covered by an impermeable surface, such as a structure or pavement, a 12-inch thick layer of a low permeability soil should be placed over the backfill to reduce surface water migration to the underlying soils.

All retaining wall backfill should be placed and compacted under engineering controlled conditions in the necessary layer thickness to ensure a minimum in-place density of 90 percent of the maximum dry density as determined by the Modified Proctor test (ASTM D1557). Care should be taken to avoid over-compaction of the soils behind the retaining walls, and the use of heavy compaction equipment should be avoided.

Retaining Wall Back Drains

The retaining walls shall be provided with water- or damp-proofing in accordance with the architects recommendations. Back drains and chimney drains shall be installed to collect and divert migrating groundwater. As a minimum, each wall shall be drained by placing a 4-inch diameter pipe perforated (faced down) PVC Schedule 40 pipe or approved equivalent, located behind the base of the wall. The pipe shall be covered by ¾-inch crushed rock at a rate of not less than 2 cubic ft. per linear ft. of pipe surrounded in turn by geofabric such as Supac 4NP or equivalent.

All wall backfill shall be compacted to a minimum 90 percent relative compaction in accordance with ASTM D-1557. Wall back drains shall outlet separately and not be combined with area drains.

This office shall be contacted to provide additional recommendations if actual conditions are different than those assumed above. During construction, drainage devices shall be inspected by a representative of EGA Consultants.

Landscape/Retaining Wall Waterproofing

In accordance with Section 1805.3 of the 2022 CBC, the retaining walls shall be sealed and waterproofed using the miradrain and miraclay (i.e. Grace 3000) waterproofing system, or equivalent. Joints in the membrane shall be lapped and sealed in an approved manner. Protection board shall be used to protect the membrane during and after backfilling.

The contractors shall strictly follow the manufacturer's recommendations for the for use of water-proofing products.

Retaining Wall Back Drains Along P.L. *if any*

Water in the retained earth will be drained into the channel drains at each bay via the miradrain panels which will be attached to the lagging (sealed with miraclay waterproofing). Due to space constraints along the side yard property lines, the typical gravel encased backdrains pipes should be replaced with the implementation of the miradrain, waterproofing, and outlet drains at each bay (a.k.a. "J-Drains").

SHORING PARAMETERS

Note: The current residence pad is roughly 90 to 100 ft. above MSL; and the proposed finished floor elevation for the basement is currently undetermined. The precise limits of retaining wall construction are not yet available. However, based on preliminary drawings by Brandon Architects, it appears that shoring will be required where temporary construction slopes cannot be created or are feasible such as along the rear and side yards.

In cases where the shoring may need to double as landscape walls, and/or landscape features (e.g. exterior stairs, boundary fences, walls), then those sections should be designed as permanent. The structural engineers should interface with the architect and landscape designer to determine location of exterior elements.

The limits of the shoring soldier piles and temporary excavation lay back cuts shall be shown in the future grading plan.

The following equivalent fluid pressures may be used in the design of the permanent or temporary shoring:

Caissons

The caissons shall be a minium 24 inches in diameter, embedded a minimum 5 feet into bedrock. Caissons may be designed for both end bearing and friction. Caissons may be designed for an allowable bearing capacity of 5,000 psf and a

skin friction of 250 psf (neglect the upper 3 feet of fill). The precise caisson dimensions and steel reinforcement shall be determined by the project structural engineer.

The minimum clear spacing between the H-beams should be three effective H-beam diameters, sidewall to sidewall. The maximum clear spacing between H-beams should *not exceed* five effective H-beam diameters, sidewall to sidewall.

No additional significant surcharge will be added since the structures shall be supported by deepened footings embedded into competent bedrock. The fill/topsoil shall be removed in those areas. All excavation bottoms should be inspected/approved by the geotechnical consultant.

To protect adjacent properties we recommend that the annulus spaces behind the lagging be backfilled with a minium 2-sack slurry. The slurry backfill shall be performed as soon as possible during the shoring installation and shall be monitored/documented by the geotechnical consultant.

After the shoring system is in-place, the excavation of the basement may begin. If concrete and slurry is used for backfill, these materials should be allowed to cure prior to excavation of the basement. Care should be taken to ensure that the lagging drops down as the excavation advances. Any gaps in the lagging could cause undermining of the adjacent structures. To prevent caving of the sidewalls, the lagging elements should be forced down either behind the soldier piles or at an appropriate place within the flanges of the "H" and through the existing soils. The slurry materials that were placed within the soldier pile borings may be broken an removed during the lagging process. The lagging elements should not be driven or vibrated into place due to the possible damage that could occur to nearby structures.

These shall be considered minimum requirements and incorporated into the Foundation, Grading, Retaining Wall, and Shoring Plans. The survey monitoring requirements shall be posted in the Shoring Plan by others. This office should review the plans when available.

Active Earth Pressures

For cantilever shoring systems, an active earth pressure (equivalent fluid pressure) of 45 pounds per cubic foot may be considered for the on-site fill and the native soils. It should be noted that under this condition, the movement of shoring H-beams are not restrained so that the soil internal strength can be fully mobilized.

At-Rest Earth Pressure

If the piles are restrained at the top, then an at-rest earth pressure of 65 pounds per cubic foot should be used in design.

Passive Pressure

A passive earth pressure increasing of *300 psf per foot* of width of a shoring H-beam, per foot of depth, to a maximum value of 3,500 pounds per square foot may be used to determine lateral resistance for the piles (*600 psf-ft* may be used for temporary shoring). All soldier piles should extend at least 10 feet into competent bedrock. The passive resistance should be ignored for the upper 2 feet of the H-beams embedded below the lowest cut grade.

This office shall be contacted to provide additional recommendations if actual conditions are different than those assumed above. During construction, all waterproofing and drainage devices shall be inspected by a representative of EGA Consultants.

Soldier Pile Installation Observations

All soldier pile drilling and installation should be observed by the project geotechnical consultant to verify that they are cast against the anticipated geotechnical conditions, that pile excavations are properly prepared, that proper dimensions are achieved, and that proper installation procedures are followed.

Soldier Pile Monitoring by Others

We recommend a minimum of 8 (eight) monitoring points installed by a Licensed Surveying company. At least four of the monitoring points shall be established near each of the side yard property lines on the drilled shoring piles. The settlement monitoring points shall be monitored for horizontal and vertical movement prior and subsequent to the completion of construction, and on a daily basis during the grading and basement construction.

Stability of Temporary Excavations

During the construction and remedial grading within areas that may not require shoring and recessed portions of the proposed basement, temporary excavations with sidewalls varying up to approximately 12 feet in height will be created. For some portions of the basement excavation, shoring may not required as there may be sufficient space for temporary sloping back cuts. The shoring layout shall be determined when the construction plans are finalized and made available.

Based on the results of our subsurface investigation, it is expected that the temporary excavation sidewalls will expose dense to very dense terrace and bedrock deposits with favorable shear strength.

Vertical cuts will not exceed 5 feet in height. Based upon the nature of the subsurface soils, vertical cuts may extend to 4 feet, and laid back (tapered) at an inclination of 1:1 (horizontal to vertical). The temporary excavation parameters

shall be shown in the future grading plan.

Temporary unsupported sidewalls constructed at the recommended maximum gradient are expected to remain stable for the duration of the remedial grading operations; however, all temporary slopes should be observed by a representative of the project geotechnical consultant for any evidence of potential instability.

All applicable requirements of the California Construction and General Industry Safety Orders, the Occupational Safety and Health Act of 1970, and the Construction Safety Act should also be followed.

New Garage Grade Beam

A grade beam, reinforced continuously with the garage footings, should be constructed across the garage entrance, tying together the ends of the garage footings. This grade beam should be embedded at the same depth as the adjacent perimeter footings.

Hardscape

Exterior slabs shall conform to the requirements for interior slabs except that the moisture barrier may be omitted and the thickness may be reduced to 4-inches, and the reinforcement may be reduced to No. 3 rebar at 24 inches on center.

Control joints should be provided at a maximum spacing of 8 feet on center in two directions for slabs and at 6 feet on center for sidewalks. Control joints are intended to direct cracking. Minor cracking of exterior concrete slabs on grade should be expected.

Expansion or felt joints should be used at the interface of exterior slabs on grade and any fixed structures to permit relative movement.

New Fences/Garden Walls

New fences or garden wall footings, if any, should be founded a minimum of 18-inches into approved firm materials. To reduce the potential for unsightly cracks due to expansion forces, we recommend inclusion of construction joints at 8-ft to 15-ft intervals.

Surface Drainage

Surface drainage shall be controlled at all times. Positive surface drainage should be provided to direct surface water away from structures and toward the street or suitable drainage facilities. Ponding of water should be avoided adjacent to the structures. Roof gutter discharge should be directed away from the building areas through solid PVC pipes to suitable discharge points. Area

drains should be provided for planter areas and drainage shall be directed away from the top of slopes.

Small slopes, when occurring, shall be properly drained and landscaped (such as non-homogeneous, drought-tolerant, deep-rooted plants) and maintained.

In general, the more the surface water can be controlled, the less surface water will infiltrate the underlying earth materials. All drainage should be controlled and diverted away from the on site structures and to a suitable discharge at Bayview Drive or Heliotrope Avenue.

Review of Plans

The specifications and parameters outlined in this report shall be considered minimum requirements and incorporated into the Grading, Foundation, Shoring, Landscape, Shoring plans and Pool/Spa (if any). This office should review the Plans when available. If approved, the geotechnical consultant shall sign/stamp the applicable Plans from a geotechnical standpoint.

Based on the findings of our geotechnical investigation and our professional experience working on similar sites in the area, the proposed construction will not impact the stability/safety of the subject or surrounding sites. Geologic hazards such as landsliding, settlement, or slippage are not present or future factors at the subject or adjacent sites.

Geotechnical observations/testing should be performed during all grading operations, including excavations, waterproofing, drain device installments, removals, filling, compaction, and backfilling, etc.

GEOTECHNICAL OBSERVATION AND TESTING DURING CONSTRUCTION

We recommend that a qualified geotechnical consultant be retained to provide geotechnical engineering services, including geotechnical observation/testing, during the construction phase of the project. This is to verify the compliance with the design, specifications and or recommendations, and to allow design changes in the event that subsurface conditions differ from those anticipated.

Geotechnical observations/testing should be performed at the following stages:

- During ANY grading operations, including excavation, removal, filling, compaction, and backfilling, etc.
- After excavations for footings/grade beams and/or drilling for soldier piles/caissons, if any to verify the adequacy of underlying materials.
- After excavation for retaining wall footings to verify the adequacy of underlying earth materials.
- During/after installation of water proofing for retaining walls, if any prior to installation of sub-drain/backfilling.
- During/after installation of retaining wall sub-drain, prior to backfilling.
- During compaction of retaining wall backfill materials to verify proper compaction.

- After pre-soaking of new slab sub-grade earth materials, prior to pouring concrete.
- Verification of the placement of the slab underlayment prior to pouring concrete.
- Prior to slab pours to ensure proper subgrade compaction, capillary breaks, and moisture barriers.
- Placement of waterproofing at cold joints and penetrations (e.g. bentonitic "Water Stops").
- During backfill of drainage and utility line trenches, to verify proper compaction.
- When/if any unusual geotechnical conditions are encountered.

Please schedule an inspection with the geotechnical consultant prior to the pouring of ALL interior and exterior slabs (includes waste and protection slabs).

DIMENSION NOTE:
ALL DIMENSIONS ARE TO FACE OF SHEATHING (EXT. WALLS) OR FACE OF STRUCTURE (F.O.S.) TYP. U.N.O. ROUNDED TO THE NEAREST 1/8". AND INTERIOR PARTITIONS ARE DIMENSIONED FROM FACE OF STRUCTURE TO FACE OF STRUCTURE (F.O.S.) U.N.O. - CONTACT ARCHITECT IN WRITING FOR ANY CLARIFICATION OF NOTED DIMENSIONS, **DO NOT SCALE PLANS.**

ROUGH FRAMING:
ALL EXTERIOR WALLS TO BE FRAMED W. 2X6 STUD MIN. U.N.O.
USE 2X6 MINIMUM STUDS FOR PLUMBING WALLS
SECOND AND THIRD FLOOR PLYWOOD TO BE 1-1/8"
ENTIRE EXTERIOR TO BE SHEATHED WITH MINIMUM 1/2" PLYWOOD
DOORS AND WINDOWS WILL TYPICALLY BE RECESSED FROM EXTERIOR WALL PLANE. VERIFY ALL ROUGH OPENING DIMENSIONS WITH DOOR AND WINDOW MFGR. ROUGH OPENING MAY NEED TO BE OVERSIZED TO ACCOUNT FOR ADDITIONAL FRAMING. SEE SHT. AD-2.0 FOR TYP. RECESSED CONDITIONS.

GARAGE FLOOR:
GARAGE FLOOR SURFACES SHALL BE OF APPROVED NONCOMBUSTIBLE MATERIAL:THE AREA OF FLOOR USED FOR PARKING OF AUTOMOBILES OR OTHER VEHICLES SHALL BE SLOPED TO FACILITATE THE MOVEMENT OF LIQUIDS TO A DRAIN OR TOWARD THE MAIN VEHICLE ENTRY DOORWAY. (R309.1)

PLUMBING:
1. SUPPORT ALL WALL-HUNG FIXTURES WITH METAL SUPPORTING MEMBERS TO PREVENT ANY STRAIN TRANSMISSION TO THE CONNECTIONS. FRAMING AFFIXED SUPPORTS FOR OFF-THE-FLOOR WATER CLOSETS WITH CONCEALED TANKS SHALL COMPLY WITH ASME A112.6.2. SECURE FLUSH TANK AND SIMILAR APPURTENANCES WITH APPROVED NON-CORROSIVE SCREW OR BOLTS. (CPC 402.4)

2. THE NET AREA OF THE SHOWER ENCLOSURE SHALL BE 1,024 SQ. INCHES (7.1 SQ. FT.) OR MORE FROM TOP OF THRESHOLD TO 70" ABOVE DRAIN, AND SHALL ALSO BE CAPABLE OF ENCOMPASSING A 30-INCH DIAMETER CIRCLE. (CPC 408.6)

3. THE WATER HEATER BURNER AND BURNER-IGNITION DEVICE TO BE AT LEAST 18-INCHES ABOVE THE FLOOR, IF LOCATED IN A GARAGE AND IN ADJACENT SPACES THAT OPEN TO THE GARAGE. FOR WATER HEATER IN THE GARAGE OR OTHER AREAS SUBJECT TO MECHANICAL DAMAGE PROVIDE A PROTECTIVE BARRIER OR ELEVATE THE APPLIANCE TO BE OUT OF THE NORMAL PATH OF THE VEHICLE. (CPC 507.13)

4. ANCHOR OR STRAP THE WATER HEATER(S) TO RESIST HORIZ. DISPLACEMENT DUE TO THE EARTHQUAKE. STRAPPING SHOULD BE AT THE UPPER AND LOWER ONE THIRD (1/3) POINTS OF THE APPLIANCE HEIGHT. MAINTAIN A MIN. 4-INCHES ABOVE THE CONTROLS WITH STRAPPING AT LOWER POINT. (CPC 507.2)

WOOD OR WOODBASED PRODUCTS NOTE: (CRC R317.1) (REF. B /T-1.1 FOR MORE INFO).
PROTECTION OF WOOD AND WOODBASED PRODUCTS FROM DECAY SHALL BE PROVIDED IN THE FOLLOWING LOCATIONS BY THE USE OF NATURALLY DURABLE WOOD OR WOOD THAT IS PRESERVATIVE-TREATED IN ACCORDANCE WITH AWPA U1.

1.IN CRAWL SPACES OR UNEXCAVATED AREAS LOCATED WITHIN THE PERIPHERY OF THE BUILDING FOUNDATION, WOOD JOISTS OR THE BOTTOM OF A WOOD STRUCTURAL FLOOR WHERE CLOSER THAN 18 INCHES (457 MM) TO EXPOSED GROUND, WOOD GIRDERS WHERE CLOSER THAN 12 INCHES (305 MM) TO EXPOSED GROUND, AND WOOD COLUMNS WHERE CLOSER THAN 8 INCHES (204 MM) TO EXPOSED GROUND.

2. WOOD FRAMING MEMBERS, INCLUDING COLUMNS, THAT REST DIRECTLY ON CONCRETE OR MASONRY EXTERIOR FOUNDATION WALLS AND ARE LESS THAN 8 INCHES (203 MM) FROM THE EXPOSED GROUND.

3.SILLS AND SLEEPERS ON A CONCRETE OR MASONRY SLAB THAT IS IN DIRECT CONTACT WITH THE GROUND UNLESS SEPARATED FROM SUCH SLAB BY AN IMPERVIOUS MOISTURE BARRIER.

4.THE ENDS OF WOOD GIRDERS ENTERING EXTERIOR MASONRY OR CONCRETE WALLS HAVING CLEARANCES OF LESS THAN 1/2 INCH (12.7 MM) ON TOPS, SIDES AND ENDS.

5.WOOD SIDING, SHEATHING AND WALL FRAMING ON THE EXTERIOR OF A BUILDING HAVING A CLEARANCE OF LESS THAN 6 INCHES (152 MM) FROM THE GROUND OR LESS THAN 2 INCHES (51 MM) MEASURED VERTICALLY FROM CONCRETE STEPS, PORCH SLABS, PATIO SLABS AND SIMILAR HORIZONTAL SURFACES EXPOSED TO THE WEATHER.

6.WOOD STRUCTURAL MEMBERS SUPPORTING MOISTURE-PERMEABLE FLOORS OR ROOFS THAT ARE EXPOSED TO THE WEATHER, SUCH AS CONCRETE OR MASONRY SLABS, UNLESS SEPARATED FROM SUCH FLOORS OR ROOFS BY AN IMPERVIOUS MOISTURE BARRIER. THE IMPERVIOUS MOISTURE BARRIER SYSTEM PROTECTING THE STRUCTURE SUPPORTING FLOORS SHALL PROVIDE POSITIVE DRAINAGE OF WATER THAT INFILTRATES THE MOISTURE-PERMEABLE FLOOR TOPPING.

7.WOOD FURRING STRIPS OR OTHER WOOD FRAMING MEMBERS ATTACHED DIRECTLY TO THE INTERIOR OF EXTERIOR MASONRY WALLS OR CONCRETE WALLS BELOW GRADE EXCEPT WHERE AN APPROVED VAPOR RETARDER IS APPLIED BETWEEN THE WALL AND THE FURRING STRIPS OR FRAMING MEMBERS.

8.PORTIONS OF WOOD STRUCTURAL MEMBERS THAT FORM THE STRUCTURAL SUPPORTS OF BUILDINGS, BALCONIES, PORCHES OR SIMILAR PERMANENT BUILDING APPURTENANCES WHERE THOSE MEMBERS ARE EXPOSED TO THE WEATHER WITHOUT ADEQUATE PROTECTION FROM A ROOF, EAVE, OVERHANG OR OTHER COVERING THAT WOULD PREVENT MOISTURE OR WATER ACCUMULATION ON THE SURFACE OR AT JOISTS BETWEEN MEMBERS.

9.WOOD COLUMNS IN CONTACT WITH BASEMENT FLOOR SLABS UNLESS SUPPORTED BY CONCRETE PIERS OR METAL PEDESTALS PROJECTING NOT LESS THAN 1 INCH (25 MM) ABOVE THE CONCRETE FLOOR AND SEPARATED FROM THE CONCRETE PIER BY AN IMPERVIOUS MOISTURE BARRIER.
